

Original renderer reference

Original earthquake HTML, JavaScript and assets at 12 September 2026, 12:00-16:00 UTC. Read-only request-fixture comparison, not a running Java backend. This initial legacy view has its overview hidden.

Current Python-backed timeline

The same four-hour interval contains 42 actual records from the earthquake and volcano sources. Colored hazard icons, measured labels and quarter-hour grid divisions appear above a 383-record overview.

Standalone search and overview

The offline snapshot includes all 383 records in its declared two-day range, not the entire server archive. Kilauea is highlighted in yellow; only its finding remains in the overview. Other main-band records retain context.

Selection and read-only descriptor

Selecting an actual event opens its descriptor beside the timeline. Source JSON remains unchanged, and write controls are disabled. Label layout is recalculated for the available width.

Mobile standalone view

The same embedded JavaScript, font subsets and hazard images operate without HTTP or Python. Vertical row pages keep the selected interval and overview visible; the complete chosen snapshot remains browseable.
