

NAMESPACE: three selected paths

Verified Python-backed test fixture: six records in three namespaces, translucent zones and a synchronized overview. Grouping uses each record's namespace. These are synthetic test records, not production March 18 data.

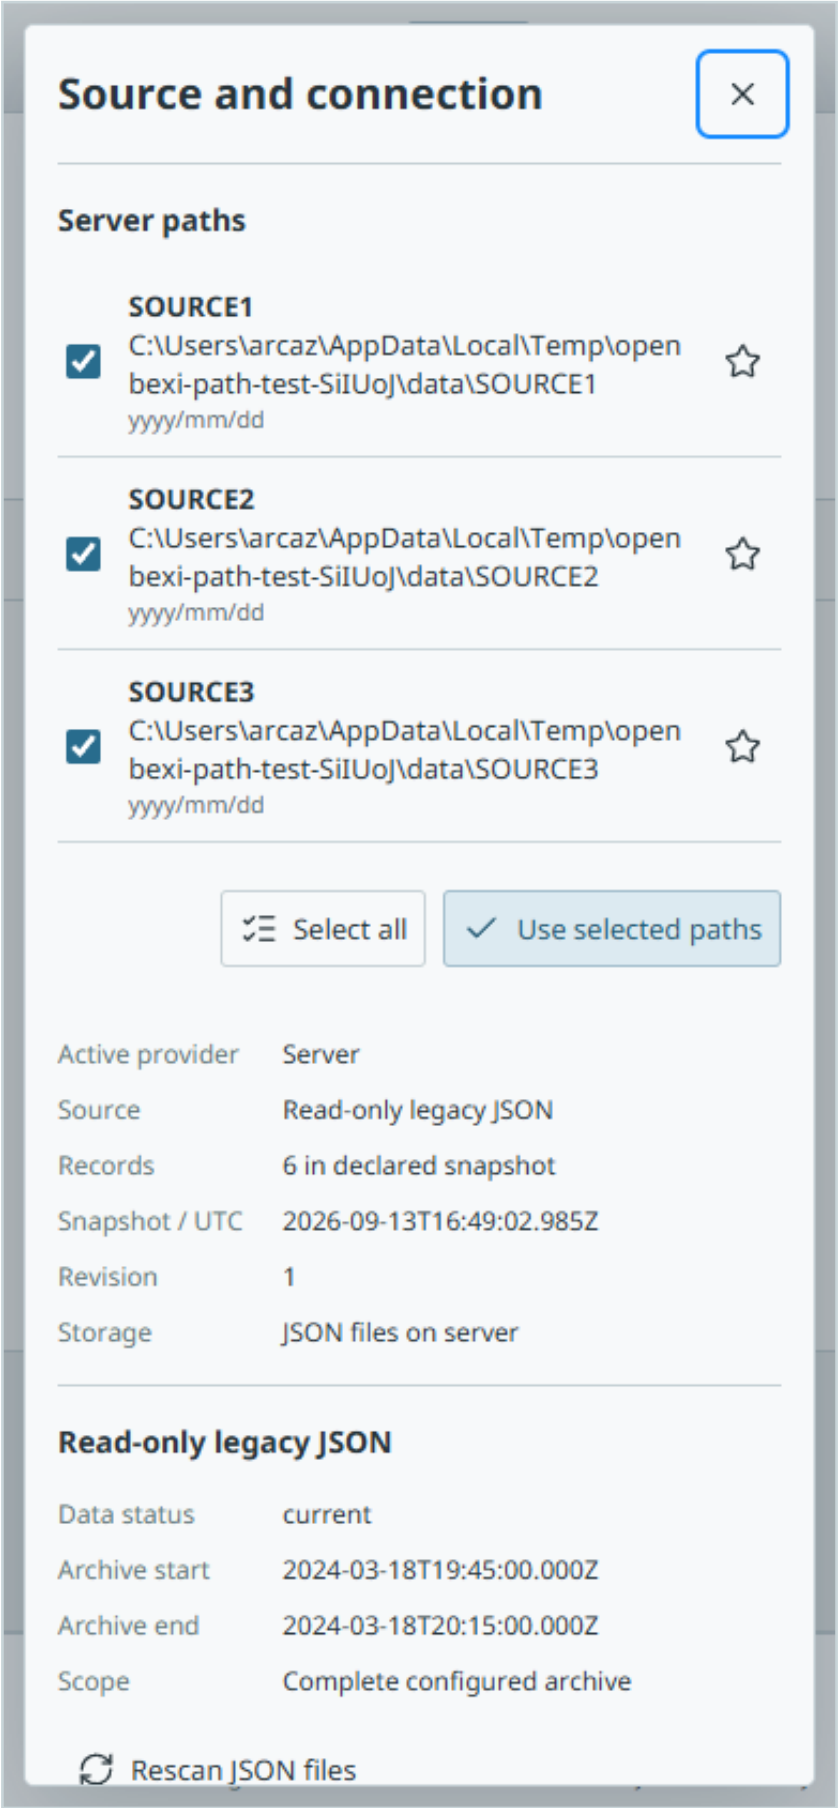

ALL: combined selected sources

The same test fixture after deselecting SOURCE3. ALL combines SOURCE1 and SOURCE2 without separate namespace headers. Favorite paths remain available in the toolbar. Local server access does not require entering a bearer token.

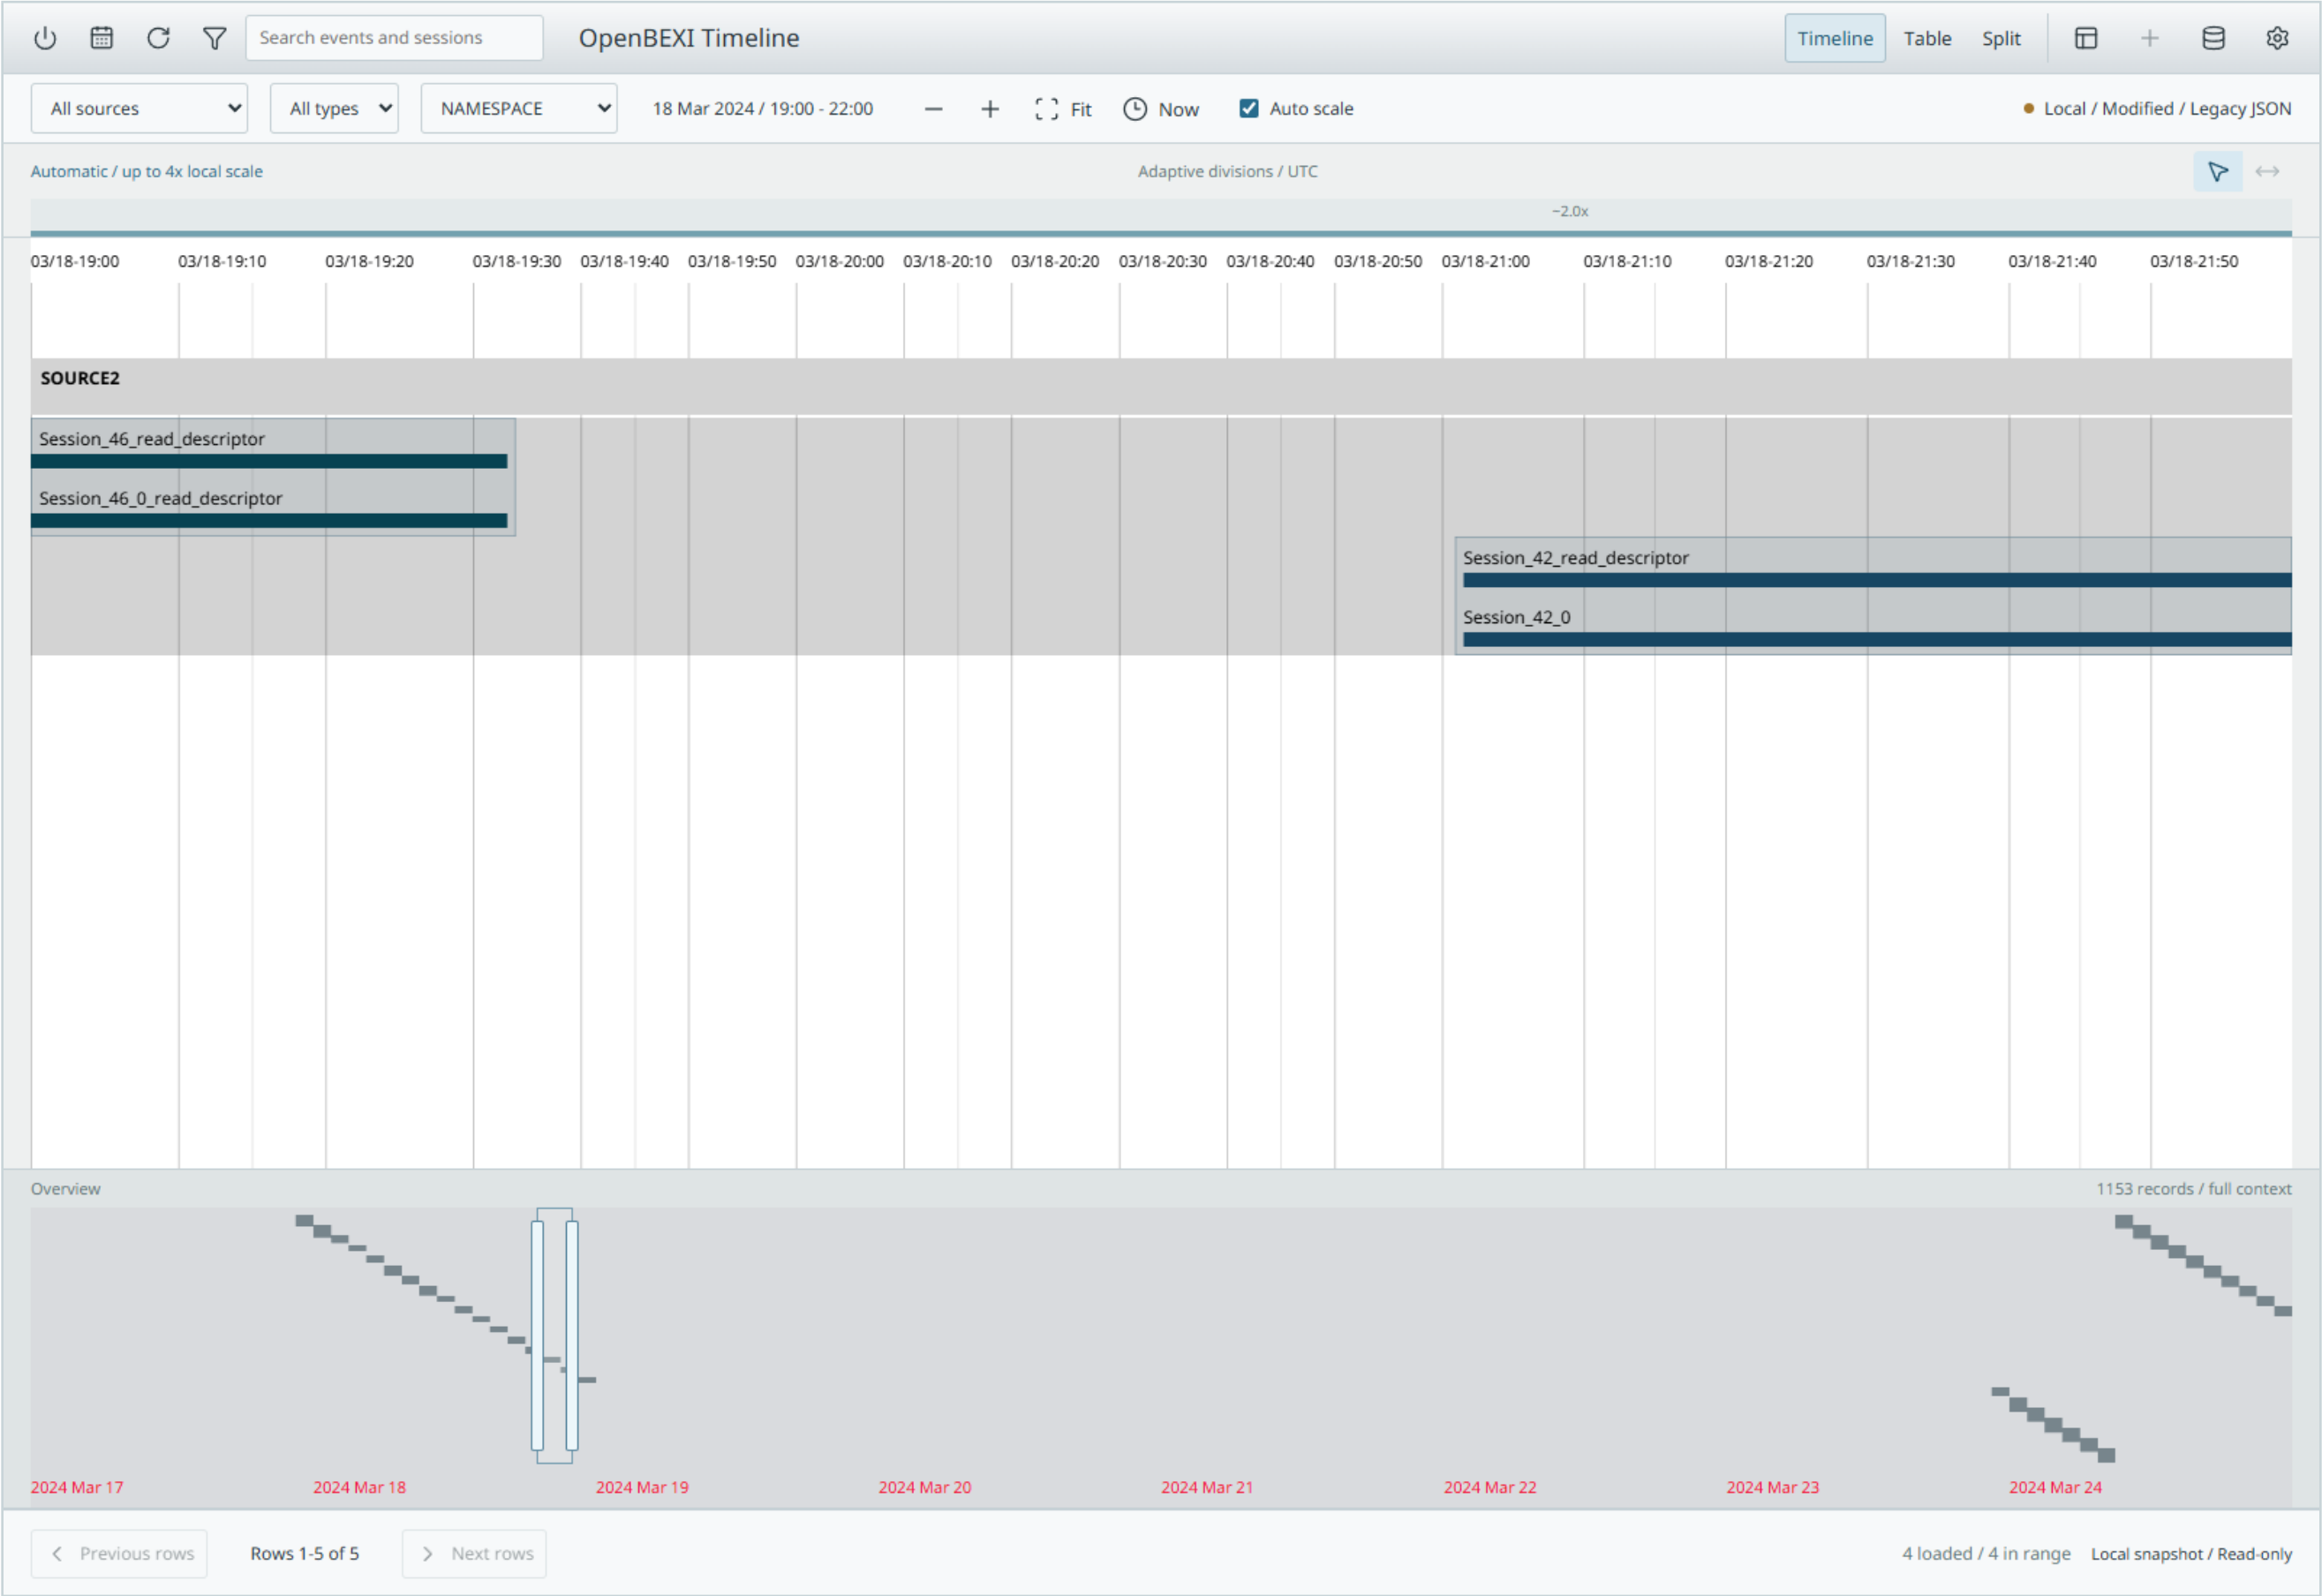

Server paths and favorites on mobile

The browser selects approved source IDs; Python reads the corresponding paths. Checkboxes support multiple selections and stars add toolbar shortcuts. The temporary filesystem paths shown here belong to the isolated test server.

Actual SOURCE2: March 18, 2024

19:00-22:00 UTC, from an unmodified production-data export. This Local snapshot includes every record in its declared March 17-25 range, not the entire server archive. Production SOURCE1 has no March 18 sample records.

Actual SOURCE1: March 24, 2024

19:00-22:00 UTC. The source's legacy black background is retained. Vertical pages preserve readable labels and the broader overview; dense namespaces can span pages. No dates were shifted to populate additional lanes.
